Key Findings

Revenue Impact

Canceled bookings make up 27% of all bookings but 33% of Potential Estimated Revenue, suggesting that canceled bookings tend to have a higher estimated value than average.

Cancellation Trends

Cancellation rates are higher for longer lead times but lower when guests make more special requests. These are observed patterns, not proof of causation.

Customer Value

Couples generate the highest total revenue in both hotels due to booking volume, while Adult Groups and Families have higher average revenue per booking.

Hotel Bookings Overview

- Resort Hotel stays are mostly 4–7 nights, while City Hotel bookings are mainly 2–3 nights.
- City Hotel has more bookings, higher estimated revenue potential and a higher cancellation rate .
- City Hotel bookings are mostly made 8–30 days in advance, while Resort Hotel bookings are concentrated within 7 days of arrival.

Cancellation Revenue Impact

- Higher revenue loss rates are observed in City Hotel, while Resort Hotel records a higher average loss per cancellation.
- Family bookings have the highest average estimated loss per cancellation, while Single Adult bookings have the lowest.

Recommendations

• Lead Time Based Risk Management:
Classify bookings over 30 days into lead-time risk levels. For bookings made 31-180 days ahead, pre-arrival confirmation communication may help reduce cancellations. For reservations made 181 or more days in advance, offering flexible date modification options could be considered.

• Post-Booking Customer Engagement:
Given the relationship between a higher number of special requests and lower cancellation rates, maintaining communication with guests after booking may help strengthen engagement and reduce cancellations and could be tested on a small group.

• Cancellation Reasons Analysis:
Surveys can be conducted with guests in the Family and Adult Group segments to better understand the factors associated with their higher cancellation rates and identify potential improvement areas.

Guest Analysis

- Resort Hotel shows higher revenue per booking despite a lower ADR, while longer stays are also observed in this hotel type.
- Adult Groups have the highest average booking revenue.
- Single Adult guests have the highest repeated-guest ratio in both hotels

Cancellation Rate Analysis

- Higher cancellation rates are observed among Adult Group in City Hotel and Family in Resort Hotel. Single Adult has the lowest rate.
- Cancellation rates vary by weekday/weekend stay pattern, but differences are smaller among stays of the same length, suggesting that stay length may be more closely associated with cancellation rates.

Limitations

Data Period: The dataset covers July 2015 to August 2017. Year-to-year comparisons are not directly comparable.

ADR: Calculated from non-canceled bookings with non-zero ADR, excluding the 'Complementary' market segment.

Deposits: Only ~1,000 of 87,000 bookings have deposit data. Deposit types are excluded from cancellation analysis and deposit bookings from revenue estimates due to limited data.

Estimated Revenue: Calculated as ADR × nights stayed. Represents accommodation revenue only; actual revenue and additional expenses are unavailable.

Estimated Lost Revenue: Calculated as ADR × reserved nights for canceled bookings. Represents potential accommodation revenue loss and excludes rooms resold after cancellation.

Potential Estimated Revenue: Sum of Estimated Revenue and Estimated Lost Revenue Represents the total accommodation revenue expected if no bookings had been canceled.

Revenue Loss Rate: Estimated Lost Revenue divided by Potential Estimated Revenue.

Guest Group:
- Single Adult (16K): One adult, no children.
- Couple (56K): Two adults, no children.
- Adult Group (5K): Three or more adults, no children.
- Family (9K): Includes children or babies.

385 bookings with no recorded adult count are also classified as Family.
